

Adam Nestor

Full-Stack Software Engineer

(330) 620-9982 | adam.nestor@gmail.com | Cleveland, Ohio | www.adamnester.com | [LinkedIn](#) | [GitHub](#)

Full-stack software engineer with 2+ years building scalable web applications using modern JavaScript and Java ecosystems. Experienced in React, TypeScript, Node.js, Spring Boot, and relational databases. Proven ability to deliver enterprise-grade applications from design through deployment, working effectively with cross-functional teams and diverse technology stacks

Technical Skills

Frontend: React, TypeScript, JavaScript, HTML5, CSS3, Responsive Design

Backend: Node.js, Express.js, Java, Spring Boot, Spring Security

Databases: PostgreSQL, MySQL, SQL, JPA/Hibernate

APIs & Integration: RESTful APIs, Third-party API integration, Microservices, Webhook implementation

Tools & DevOps: Docker, Git, Maven, JIRA, JWT Authentication

Testing: Jest, JUnit, JaCoCo, Test-Driven Development

AI/ML: Language model integration (Anthropic Claude API), AI-powered features

Development Practices: Agile/Scrum, Code reviews, Full SDLC participation

Work Experience

Square | March 2025 - Present

Software Engineer | Remote

- Architect full-stack applications using TypeScript, Express.js, and PostgreSQL with React frontend, implementing modern single-page application architecture and component-driven development
- Build robust RESTful APIs with Node.js handling JSON data transformation, comprehensive validation, and secure authentication flows for real-time user interactions
- Deploy containerized applications using Docker for consistent environments across development, staging, and production while managing CI/CD pipeline integrations
- Develop responsive React components with TypeScript translating product requirements and UX designs into maintainable, performant user interfaces
- Resolve critical production issues during legacy system migrations by restructuring API contracts and implementing permanent solutions to prevent recurrence
- Apply test-driven development with Jest, increasing test coverage by 20% across frontend and backend codebases through systematic identification of untested areas

We Make Good Software | August 2024 - March 2025

Full Stack Developer (Java, React, TypeScript) | Remote

- Architected enterprise messaging platform with React/TypeScript frontend and Java Spring Boot backend, integrating Anthropic Claude AI API for intelligent, context-aware automated responses
- Built AI-powered features using language models to streamline customer support workflows, reducing response times and improving user engagement through natural language processing
- Designed component-based single-page application with React implementing complex state management, real-time data binding, and seamless user experience patterns
- Developed RESTful API architecture with Spring Boot handling JSON payloads, third-party service integrations (Twilio webhooks), and authentication flows with signature validation
- Implemented relational database schema with JPA/Hibernate for PostgreSQL, optimizing queries and maintaining data integrity across distributed microservices
- Collaborated with cross-functional team of 8-9 developers using Git, Maven, Agile methodologies, and rigorous code review practices to deliver production-ready features on schedule

Projects

CourtVision - NBA Player Prediction Platform (*Java, Spring Boot, React, MySQL*)

- Built full-stack platform with React/TypeScript frontend and Spring Boot backend analyzing 180,000+ NBA statistics across 5 seasons to generate daily player performance predictions
- Architected scalable RESTful API with Spring Boot handling complex data queries, JSON transformation using Jackson library, and efficient client-server communication
- Engineered intelligent data pipeline with rate limiting (600 req/min), batch processing, throttling, and caching strategies to optimize third-party API consumption while maintaining data freshness
- Designed responsive React component architecture managing complex application state, real-time data updates, and interactive data visualizations with full TypeScript type safety
- Implemented authentication with Spring Security and JWT tokens, following REST API best practices for secure, scalable endpoint design
- Built normalized MySQL database schema with JPA/Hibernate ORM and optimized indexing, processing 300 new entries daily with efficient query patterns
- Deployed with Docker containerization for consistent local development and production environments

Education

Coders Campus - Full-Stack Java Software Engineering Bootcamp, 2023

University of Akron - M.S. Education (2012), B.A. Philosophy (2010), Akron, Ohio
